

Audion Setup for Total Commander

[Русский](#)

A file manager configuration that can be distributed.

Why It Exists

A configured file manager means panels, menus, colours, shortcuts, embedded scripts. It takes years to assemble and travels badly: the settings are spread across several files, some in a non-standard encoding, some tied to paths.

The Central Decision

The manager itself is not included and is not modified.

The package contains only what is ours: panels, menus, colours, scripts, configuration. All of it is applied to a freshly installed manager as complete baselines — not piecemeal, and not by editing what is already there.

From which the main point follows: **the package can be distributed**. It contains no third-party program, so there is no question of the right to redistribute one.

Next

- Run `Setup_En.exe` in the root (`Setup_Ru.exe` is the same wizard in Russian): it asks where to install, which set (Initial / Audion / Ultimate, or a profile by occupation), which menu language, and which programs, editors and plugins you want. It fetches Total Commander itself.
- If the way out goes through a proxy - the "Proxy" button in the top corner of the window: an address like `http://127.0.0.1:8080` or `socks5://name:password@10.0.0.5:1080`, and the button knocks through it before taking it. The address is yours alone: none sits in the code, it lives only while the window is open and reaches the installation through the environment - neither disk nor log sees it, so a password in it leaves no trace.

- The build speaks one language throughout, and the Total Commander menu sets it: the console, the program installer, the picker and the atlas read the choice from `Wincmd.ini` and answer in it. To switch, use the "Interface language" item. A German menu gets English scripts — the manager has a German translation, our strings do not.
- The build's documentation lives in `Payload\Docs\` : `USER_GUIDE.md` for the daily work, `PROJECT.md` for how it is built.
