Audion System Manager

Русский · User guide

One window for the developer environment on Windows: **PowerShell 7**, **Windows Terminal**, **Python 3.12, 3.13 and 3.14**, **VS Code**, **Git** with **GitHub CLI**, and the agents of the console **Claude Code**, **Codex**, **Grok Build**, **Antigravity CLI**. Each program can be installed for the system or unpacked as a portable folder — with every option a package manager does not give, and with the Audion settings. With buttons: no black console window, no command-line switches.

Why

A package manager installs a program but does not set it up. An installer wizard offers options nobody remembers half a year later. And the settings after the install are put together again on every machine. The program takes all of that on itself.

Section	For the system	Portable
POWERSHELL 7	the MSI for the whole machine with every option: Explorer menus, PATH, event log, updates through Microsoft Update; the Audion profile	the zip of the release in a folder
TERMINAL	Windows Terminal from the Store (or through WinGet) and the Audion settings in every terminal found; the default terminal; Cascadia Nerd Font	the zip of the release in a folder, settings beside it
PYTHON	3.12, 3.13 or 3.14, side by side: the python.org installer for all users, every version into its own folder, the path at the front of PATH, the py launcher, no Store stubs; pip of every Python	python.org's full archive with pip
VS CODE	the installer for the machine or the profile with every box of its wizard, the settings, keys and snippets, the extensions by the lists	the archive in a folder with its data folder, updated without losing the settings

Section	For the system	Portable
GIT	Git for Windows with every box of its wizard; GitHub CLI with sign-in in the browser; the Audion Git settings, the personal ones left alone	PortableGit in a folder, GitHub CLI beside it

The **AI CLI** section installs and updates Claude Code, Codex, Grok Build and Antigravity CLI with their authors' installers, and signs in and out with your subscription (OAuth in the browser) by a button for each.

Administrator rights are asked for only for an install for the whole machine — by the UAC prompt of the installer. Downloads go to `Download`, portable builds to `Portable`: **the folder can be carried to another machine whole**.

Starting

`Start.exe`. The details are in the user guide.
