

Audion TourBox Presets Translator

[Русский](#) · [User Guide](#)

Presets for the TourBox controller — as text, not as clicks in the vendor application.

Why It Exists

Configuring the controller for your work means assigning fifty-odd actions to buttons, wheels, and their combinations. In the vendor application that is done with a mouse, one action at a time, and the result can neither be reviewed as a whole, nor sent to a colleague as text, nor put under version control.

Here a preset is described **in words**, and the program builds a working file from that description.

What Else Is Inside

A complete description of the preset file format — **with evidence for every point**. Not "this field probably means such-and-such", but a format taken apart by example: what changes in the file when you change a particular setting in the vendor application.
