

Audion Zapret Updater

[Русский](#)

Installs and updates a traffic-filtering bypass tool with one click.

Why It Exists

Updating such a tool is not "download the new version". You have to stop the service, remove the driver, put the new build in place of the old, restore your own domain lists, and start it back up. Miss a step and you have a broken setup and an opaque error.

The Rule

A folder is there — update it. It is not — install from scratch.

No questions, no mode selection: the program looks at what is already present and does what is needed.

What Is Preserved

Your domain lists. They are restored after the update — otherwise updating would mean configuring everything again.

Next

- Installation and running — one file, no parameters.
